

AIM

Enhanced Integration Process for the Residential Construction Industry

Advanced Integration

America's Home Builders are burdened with trying to integrate information and systems across numerous platforms and environments that contain incompatible systems. This creates complexity and duplication of services, increasing overhead. Advanced Integration Manager (AIM), a B2B integration suite developed to connect BuildPro to most all major ERP systems, is here to end that.

See the Benefits

✓ Enhanced Proactivity

With AIM, you immediately know when errors occur and have the tools to proactively address those errors. The ability to trace all messages also adds to your level of control and peace of mind.

✓ Immediate Functionality Updating

Maintenance, upgrades and new functionality are immediately released to all parties. This gives IT immediate visibility to all business events across the enterprise. Real-time decisions can be made at a moment's notice.

✓ Configure for JDE

AIM enables builders to manage enterprise data between Hyphen BuildPro and JD Edwards, ensuring that applications can exchange data and update accordingly. Using your standard methodology, you can be up and running in as little as 6-weeks.

✓ Event Detection

To enhance business intelligence across enterprise applications, BuildPro with AIM will pick up any changes made in the ERP system. Any changes will be indicated in a dashboard within BuildPro.

✓ Systems Connected

AIM provides a centralized location for information by transferring data from various sources, such as the home builder's back-office corporate systems, BuildPro schedule management systems and SupplyPro Supplier systems.

✓ Real-Time Alerts

Receive immediate alerts, monitoring, email, and other notifications as they happen. AIM is here to keep you aware and informed at all times.
